

We are proud to offer

Live Blood Cell Analysis

...a quick and effective way of revealing your current state of health

A simple drop of blood will provide you with a clear picture of how your lifestyle and current dietary practices are affecting your health...**right before your eyes!**

Also known as Live Cell Microscopy, a small blood sample is placed on a slide, viewed under a microscope, and displayed on a monitor for easy viewing. This analysis will provide you with an **early** assessment of any nutritional deficiencies, compromised immunity, and other conditions **before** real symptoms appear as disease. Live Blood Analysis also provides immediate feedback on overall health progress as nutritional improvements impact the blood.

Learn about your...

- Stress and energy levels
- State of red blood cells
- Immune system function
- Level of hydration
- Acid-Alkaline balance
- Yeast or fungal forms
- Excess proteins and undigested fats
- Hormonal imbalances
- Vitamin and mineral deficiencies

**See for yourself.
Book your appointment today!**
