

Endometrial ablation, for either elimination or reduction of heavy menstrual flows, will be available in our office beginning March 2, 2015. We will be using the Hydroablation technique which circulates heated water through a scope within the uterine cavity. This method is highly effective, safe and carries minimal discomfort during the procedure. A major advantage of doing this in clinic instead of the hospital is the substantial savings to patients since they typically pay only an office copay instead of a deductible. Please read our articles on endometrial ablation for more information.
