

SavvyLevel Installation Guide

Before you install SavvyLevel, please take the time to read and understand this guide.

This guide makes numerous references to caravan but actually refers to any type of caravan, camper, recreational vehicle, 4WD or trailer intended to have SavvyLevel installed.

STEP 1

CHOOSING A SUITABLE LOCATION

Figure 1

SavvyLevel is a bluetooth device that is mounted inside your caravan. It needs to communicate to your Smartphone device, typically used inside your tow vehicle. In order to get the best performance out of your SavvyLevel you will need to mount the device where there are minimal metallic obstructions between the device and your Smartphone. A poor location could result in poor bluetooth connectivity.

If you use the magnetic compass feature then this will also be affected if placed in close proximity to ferrous metallic objects and high powered electrical items such as ovens and refrigerators.

Since there are many different types of caravans and tow vehicles we can give no definitive statements regarding the best location to install your device. Instead we can only provide general guidelines.

To get the best performance from your SavvyLevel device you will first need to conduct some simple practical tests. We have included a 9v battery test lead for your convenience, to help facilitate with these tests.

POINTS TO CONSIDER

- **Do not** mount the device externally where it is exposed to the weather, unless it is mounted with an optional external mounting box.
- **Do not** mount the device in wet areas.

- **Do not** mount the device in close proximity to large metallic objects or large electrical devices such as ovens (including microwave ovens), refrigerators and air conditioners.
- **Do not** mount the device inside sealed metallic enclosures, or where there are significant amounts of metallic obstructions that will limit bluetooth signal range.
- **Do** mount the device as close to the front of the caravan as possible.
- **Do** mount the device where it is concealed but is readily accessible if need be (e.g. inside a cupboard or something similar).
- **Do** mount the device where it can be accessible to caravan battery supply (12v typical, but will accept a supply from 6v to 30v).
- **Do** mount the device where there are minimal metallic obstructions between the device and the interior of the intended tow vehicle (if you use your Smartphone for connection in the tow vehicle). This includes caravans that are constructed with aluminium cladding at the front. If you have bluetooth connection issues, you may need to open the front window cover first.

TESTING

The best way to test your SavvyLevel is to simulate a caravan towing situation.

1. Make sure you have the latest SavvyLevel app installed on your Smartphone.
2. Use the provided 9v battery test lead and power your SavvyLevel.
3. Test that you can connect to the SavvyLevel device. Refer to the User Manual for more details on how to use the SavvyLevel.
4. Place your caravan in an open area, with your tow vehicle located at the front of the caravan.
5. With the Smartphone located inside your tow vehicle, place the SavvyLevel device at various locations inside your caravan to determine how best to install your device.

You may want to try an overhead cupboard at the front. See *Figure 1 -1*. Or if you have a front equipment boot or a side tunnel hatch, these are generally good locations to try. See *Figure 1 -2 & 3*.

When performing these tests, make sure that the SavvyLevel device is orientated correctly. Please refer to the guidelines illustrated in 'Step 2' overleaf.

STEP 2

MOUNTING AND POWERING SAVVYLEVEL

Once you have found a suitable location you will need to mount SavvyLevel. Please follow mounting guidelines illustrated overleaf.

Connect power leads to a suitable 12v DC battery voltage source with an inline 80mA fuse. The SavvyLevel device utilises a highly efficient power regulation system, it is able to operate from wide voltage sources ranging from 6v to 30v. It only draws a tiny amount of current (less than 12mA). Although this current is small it is still recommended that the supply be switchable to preserve battery charge during long periods of non-use.

MOUNTING GUIDELINES

When mounting SavvyLevel make sure that it complies with the following illustrations:

Can be mounted face up (floor mount) and approximately level.

Cannot be mounted at an angle.

Can be mounted face down (ceiling mount) and approximately level.

Cannot be mounted at an angle.

Must be mounted parallel with caravan and with power lead extending to the back.

Cannot be mounted with power lead extending to the front.
