

ANGELIC SKIN CLINIC

Pre/Post Treatment Instructions for Chemical Peel

Pre-Treatment Instructions:

- No Sun exposure 2 weeks prior to treatment including UV tanning beds and outdoor sun exposure.
- Discontinue use of Retin-A, Renova, Differin or any derivative of Vitamin A for 5 days before and after your treatment.
- Come to treatment with clean, freshly washed face.

Post-Treatment Instructions:

- Most patients who undergo these treatments have minimal redness for 1-12 hours. You may experience light to moderate flaking up to 2 weeks post treatment. Although some clients may not have any peeling, this does not mean the treatment wasn't effective. Keratinized sun damaged skin may take a few treatments before peeling takes place.
- Your skin may feel tight and dry. Apply moisturizer as frequently as needed.
- Do not apply topical medications, AHA or BHA products to the area for 5-7 days after your treatment, as they may be irritating.
- Makeup can be applied if necessary.
- follow your appropriate home care regimen as directed by your technician.
- Avoid direct sun exposure and excessive heat for at least 7 days (getting overheated internally can cause hyperpigmentation).
- Do not pick or pull at any loose skin, as this can cause hyperpigmentation or scarring.
- Do not have any other facial treatments for 2 weeks following your treatment including Botox injections, dermal filler injections, chemical peels, LHR or microdermabrasion.
