

GROWER NOTICE

Changes to 2,4-D Labels

DETAILS

The APVMA is taking proactive action for the 2018 summer spraying season to reduce the likelihood of spray drift damage.

As of **3 October 2018**, the new 2,4-D label instructions came into effect and old labels have been suspended. Users of 2,4-D must comply with the new label instructions, even if they are using products with the old labels.

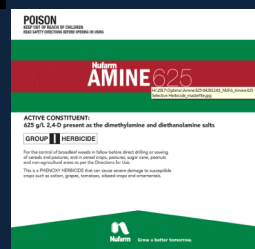

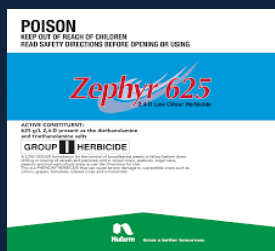

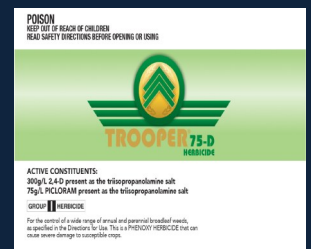

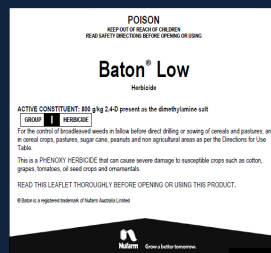

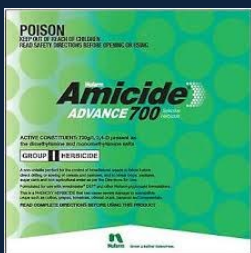

These changes affect about 220 products, and the new instructions for use include:

- a requirement not to spray in inversion conditions and additional information on recognising inversion conditions
- downwind mandatory no spray zones for both aquatic and terrestrial off target vegetation (including sensitive crops, gardens, landscaping vegetation, protected native vegetation or protected animal habitat)
- a requirement to use nozzles producing droplets no smaller than the Very Coarse spray quality category mandatory record keeping requirements, and
- advisory statements about spray application over summer.

The new requirements do not change or restrict other aspects of the currently approved use patterns and should not affect availability of the product

IBCPS will explain in more detail at grower shed meeting early 2019.

WHAT PRODUCTS DOES THIS CHANGE EFFECT IN SUGAR ?

Please Contact IBCPS is you would like to request an updated label or if you would like more information on the changes to 2,4-D label guidelines. All new 2,4-D labels that are sold out of IBCPS shops from NUFARM are attached to this email.
