

DRUGS

It is just as dangerous to drive under the influence of drugs as it is to drive under the influence of alcohol. Consider these facts:

- Marijuana: This drug produces a feeling which makes it difficult to make quick decisions, judge distances and speed, and causes slow, disconnected thoughts even hours after the high is gone.
- Stimulants: Driving under the influence of these makes it difficult to concentrate on the road or make rational judgments. When the high is gone, the user crashes with feelings of extreme tiredness and depression.
- Sedatives: Reaction time, reflexes and coordination are impaired, and the need to drive defensively diminishes.
- Hallucinogens: Makes the user see, hear, smell and feel things that aren't really there. Thoughts of panic could occur, which could cause total loss of control.

You wouldn't want to be behind the wheel while under any of these conditions, and you wouldn't want to be riding with a friend who was using any of these drugs either.

ALCOHOL AND DRUGS

Mixing alcohol and other drugs is really taking a risk. When you do this, you are multiplying the effects of both drugs, and that can mean worse effects and even sudden death.

SO GET *With* IT...

Don't drive under the influence...period. And don't ride with anyone who does. Responsible drivers keep our roads safe for everyone by not mixing alcohol, drugs and driving.
