6 A student read the following passage on the Internet.

(a)

Haloalkanes contain a polar covalent bond. The carbon atom of the polar covalent bond can be attacked by nucleophiles. Nucleophilic attack enables haloalkanes to undergo substitution reactions.

A nucleophilic substitution reaction occurs when a haloalkane undergoes

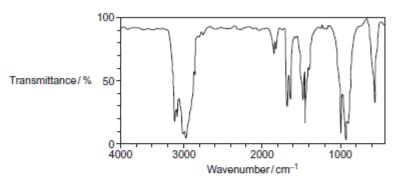

Explain the meaning of each of the following terms in the information given above.

A nucleophilic substitution reaction occurs when a haloalkane undergoes hydrolysis; the rate of hydrolysis of the haloalkane is influenced by the carbon–halogen bond enthalpy.

| (a) (i)  | nucleophile  |
|----------|--|
|          | (1 mark)   |
