That which causes you to feel something is more likely to be remembered, even if that feeling is nothing more than a little humor , surprise , or interest. We included more than activities , because your brain is tuned to learn and remember more when you do things than when you read about things. We used multiple learning styles , because you might prefer step-by-step procedures, while someone else wants to understand the big picture first, while someone else just wants to see a code example.

But regardless of your own learning preference, everyone benefits from seeing the same content represented in multiple ways. We include content for both sides of your brain , because the more of your brain you engage, the more likely you are to learn and remember, and the longer you can

stay focused. Since working one side of the brain often means giving the other side a chance to rest, you can be more productive at learning for a longer period of time. We used people. In stories, examples, pictures, etc. And your brain pays more attention to people than it does to things. So, we did our part. The rest is up to you. Try new things. Stop and think. Imagine that someone really is asking the question. The more deeply you force your brain to think, the better chance you have of learning and remembering. We put them in, but if we did them for you, that would be like having someone else do your workouts for you.

Use a pencil. That means all of them. Or at least the last challenging thing. Part of the learning especially the transfer to long-term memory happens after you put the book down. Your brain needs time on its own, to do more processing. If you put in something new during that processing time, some of what you just learned will be lost. Speaking activates a different part of the brain. Better still, try to explain it out loud to someone else. Pay attention to whether your brain is getting overloaded. Just do something to get some experience beyond the exercises and activities in this book. Your brain needs to know that this matters. Get involved with the stories. Make up your own captions for the photos. Groaning over a bad joke is. This is a learning experience, not a reference book.

To write standards-based HTML, there are a lot of technical details you need to. Our focus is on the core HTML elements and CSS properties that matter to you, the beginner, and making sure that you really, truly, deeply understand how and when to use them. This book advocates a clean separation between the structure of your pages and the presentation of your pages.

Nineties-era pages often used a different model, one where HTML was used for both structure and style. So, we encourage you to pick at least two modern browsers and test your pages using them. This will give you experience in seeing the differences among browsers and in creating pages that work well in a variety of them. One distinct difference in a Head First book is that we want you to really get it. The whole team proved how much we needed their technical expertise and attention to detail. You guys rock! And further thanks to Corey and Pauline for never letting us slide on our often too formal or we should just say it, incorrect punctuation. A shout-out to JavaRanch as well for hosting the whole thing.

Thank you, David. Our biggest thanks to our editor, Brett McLaughlin, who cleared the path for this book, removed every obstacle to its completion, and sacrificed family time to get it done. Brett also did hard editing time on this book not an easy task for a Head First title. Thank you, as always, to Colleen Gorman for her hardcore copyedit and for keeping it all fun. Finally, thanks to Mike Hendrickson for bringing us into the Head First family and having the faith to let us run with it. Thanks, guys, for trusting us even more. The three-day jam session was the highlight of writing the book, we hope to repeat it soon. Our biggest thanks to our chief editor, Mike Hendrickson, who made this book happen in every way other than actually writing it, was there for us the entire journey, and more importantly the biggest thing any editor can do totally trusted us to get it done! Thanks, Mike; none of our books would have happened without you.

Tech reviewers second edition. Once again, David was instrumental in the writing of this book. Once again, you all rock! Your feedback was amazingly thorough, detailed, and helpful. Thank you. Want to get an idea out there? Sell something? Just need a creative outlet? And there are a lot of PCs and devices connected to the Internet all running web browsers. More importantly, there are friends, family, fans, and potential customers using those devices! Web servers have a full-time job on the Internet, tirelessly waiting for requests from web browsers.

What kinds of requests? Requests for web pages, images, sounds, or maybe even a video. When a server gets a request for any of these resources, the server finds the resource, and then sends it back to the browser. That click causes your browser to request an HTML page from a web server, retrieve it, and display the page in your browser window. Browsers make requests for HTML pages or other resources, like images. And what does it do? For now, study the HTML and see how it gets represented in the browser on the next page. Be sure to pay careful attention to each letter annotation and how and where it is displayed in the browser. When the browser reads your HTML, it interprets all the tags that surround your text.

The tags tell the browser about the. So rather than just giving the browser a bunch of text, with HTML you can use tags to tell the browser what text is in a heading, what text is a paragraph, what text needs to be emphasized, or even where images need to be placed.
