

Grade, grain & colour

Grade of timber

Natural products have unique characteristics, and natural variations in grain pattern. Colours are natural characteristics of timber, not defects. These products can be divided into grades. Select grade timber means a prime grade that still allows permissible characteristics e.g. tight knots, pin holes, birdseyes, sapwood, black specks, spots, flecks, gum streaks and tight gum veins. Feature grade timber retains the natural features i.e. gum vein pockets, knots, colour streaks, cracks and grub holes.

Colour variation

Clover Doors manufactures high quality products using wide variations in colour and grain pattern. As such we can guarantee the finish, grading and species of timber that will be used but there will always be variations in colour caused by things such as growing location and the size of the tree it is cut from.

Capping Moulds

CM1 CM2 CM3

Preparation and storage

Seal all sides and edges of a door/panel with two coats of sealer. Always avoid storing doors/panels in damp areas or direct sunlight. Finish by applying two coats to all sides & edges.

Maintenance

Shrinkage is natural and easily countered with products such as Marveer, O. Cedar Polish or another equilvant product suggested by the cabinet maker using a clean rag. This will offer good protection and will enhance its appearance.

Clover Doors tailors its customer service and delivers the highest standards in workmanship.

Clover Doors also prides itself in seeking to use environmentally responsible products, such as timber from renewable sources, and providing a safe and friendly work environment for staff.
