

Sabine's Gull

Xema sabini

Category A

Very rare vagrant.

8 records,
8 birds

World/British distribution (Snow & Perrins 1998):

Breeds in Greenland and eastern Canada, then migrates south-east across the open Atlantic Ocean towards Iberia and western Morocco before turning south and heading into the South Atlantic to winter off southern Africa. Present in European inshore waters mainly after westerly gales and in Britain occurs mainly in the Western Approaches, chiefly mid-August to mid-November. Migrates north in May but with far fewer in European inshore waters in spring. Also breeds in Alaska and Siberia, with these birds wintering in the Pacific Ocean.

Kent status (KOS 2022):

It is a regular autumn migrant to Kent.

Sabine's Gull at Port Lympne (Richard Tyler)

Ticehurst (1909) provided details of a local sight record that was only the second to be noted in the county: "on September 25th, 1896, Mr J. L. Bonhote wrote to me that he was able to identify with certainty an immature bird amongst the Black-headed Gulls feeding off the parade at Folkestone. It was very tame, and he was able to note every detail of its plumage and its forked tail".

The next area record came over a century later, when Dale Gibson saw a juvenile off Copt Point on the 31st August 1997, but the third followed much more quickly, with a juvenile lingering off the same site for much of the day on the 31st August in the following year. The fourth record involved another juvenile at Copt Point on the 12th October 2000, but the fifth related to an adult or first-summer at Copt Point (and later at Folkestone Beach) on the much more unusual date of 30th June (spring and summer records are very rare in the county and this appears to be the first to have been seen in June).

The sixth record involved another autumn juvenile, seen off Battery Point on the 13th October 2021. The seventh occurrence was an exceptional long-staying inland record of a very confident juvenile in the car park at Port Lympne, from the 27th October to at least the 6th November 2022, whilst the eighth was another juvenile seen off Seabrook on the 6th November (on which date two were present in the local area).

Sabine's Gull at Port Lympne (Glenn Honey)

Sabine's Gull at Port Lympne (Steve Ashton)

The records by year are shown in figure 1.

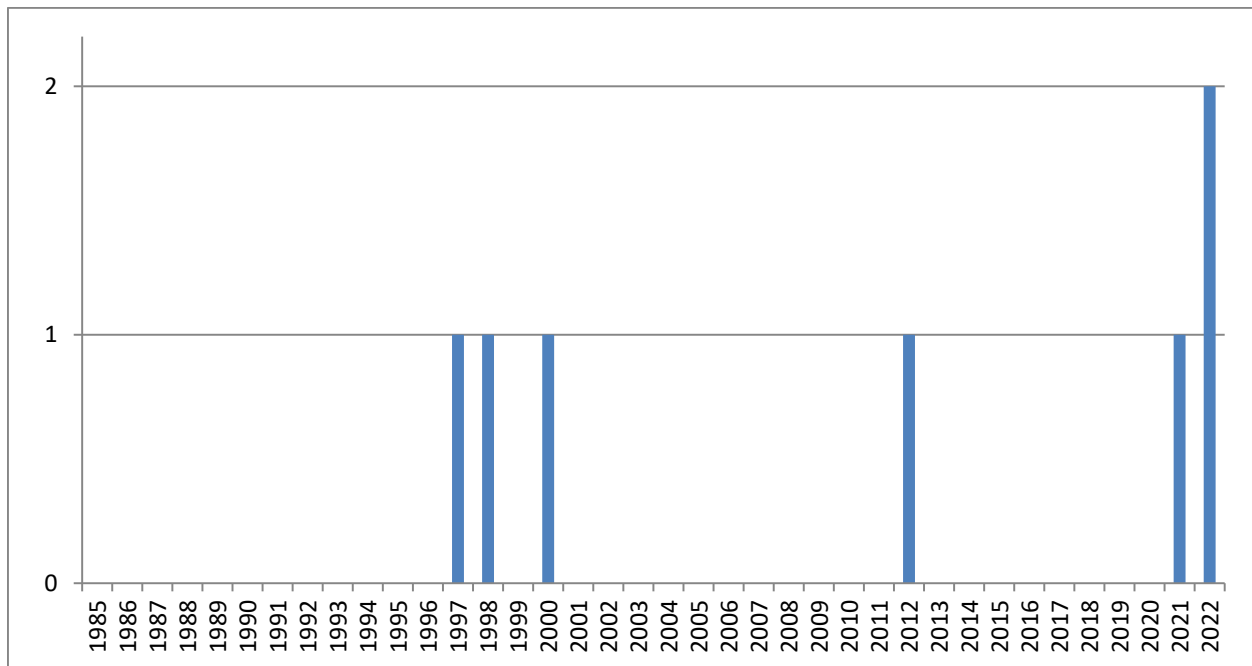

Figure 1: Sabine's Gull records at Folkestone and Hythe since 1985

Apart from the record in late June, all others have occurred in autumn, with between the 31st August (week 35) and 6th November (week 45), as demonstrated by figure 2.

The full list of records is as follows:

- 1896** Folkestone, juvenile (1CY) offshore, 25th September (J. L. Bonhote)
- 1997** Copt Point, juvenile (1CY) offshore then drifted east, 31st August (D. A. Gibson)
- 1998** Copt Point, juvenile (1CY) offshore from 08:30 to 17:30 at least, 31st August (I. A. Roberts *et al*)
- 2000** Copt Point, juvenile (1CY) flew in from east and landed on the sea, 12th October (I. A. Roberts)
- 2012** Copt Point and Folkestone Beach, adult or first-summer (2+CY) flew west, 30th June, photographed (I. A. Roberts)
- 2021** Battery Point, juvenile (1CY) offshore from 10:50 to 11:30 then flew west, 13th October (I. A. Roberts)
- 2022** Port Lympe, juvenile (1CY), 27th October to 13th November, photographed, video-recorded (P. Coleman *et al*)
- 2022** Sandgate, juvenile (1CY), offshore from 07:35 to 07:40, 6th November (C. Powell)
