

Lesser Crested Tern

Thalasseus bengalensis

Category A

Very rare vagrant.

1 record

World/British distribution (Snow & Perrins 1998):

Breeds in Libya, the Red Sea area south to Somalia, the Persian Gulf east to India, Madagascar, the Maldives, New Guinea and Australia. One or two pairs have bred in some years in Spain and Italy. Libyan birds pass through the Straits of Gibraltar to winter in West Africa. Red Sea and Persian Gulf populations disperse south along African coast and east towards India.

Kent status (KOS 2021):

Rare vagrant.

British (BBRC) records to end 2020: 9

Kent (KOS) records to end 2020: 2

There had been nine British records up to the end of 2019, including a female which returned to the Farne Islands, Northumberland each summer between 1984 and 1997, but there have been none since 2005 (BBRC no date).

The only area record involved one seen by Rob Lee at Copt Point on the 17th September 1984. It was originally submitted as a Royal Tern, but only accepted as a Royal or Lesser Crested Tern (KOS no date). However, the observer has had subsequent field experience of Royal Tern and is certain of the identification as Lesser Crested Tern.

It seems highly probable that this sighting relates to the long-staying Northumberland individual that was also seen in Kent on two subsequent occasions: flying east past Dungeness on the 6th May 1989 and at Pegwell Bay on 22nd August 1996.

The record by week is given in figure 1.

Figure 2 shows the location of the record by tetrad.

Figure 2: Distribution of all Lesser Crested Tern records at Folkestone and Hythe by tetrad

Confirmation of the only area record is as follows:

1984 Copt Point, 17th September (R. Lee).
