Provided simpler introductory examples for material students typically find especially difficult. Expanded the discussion on modeling data using linear regression. Added real-world examples to the discussion of increasing and decreasing functions and finding maxima and minima and expanded the discussion on turning points. Added real-world examples to

the discussion of average rate of change. Expanded the discussion on functions of even and odd degree and on the end behavior of polynomial functions. Added an example showing how to graph a polynomial given in factored form.

Expanded the discussion on horizontal asymptotes along with improved graphics. Added a procedure for solving logarithmic equations using exponential forms. Added material on building linear, exponential, logarithmic, and power models from data. Chapter 5 Provides an alternative way of graphing trigonometric functions by using transformations of functions and added a subsection on even—odd properties of the trigonometric functions. Chapter 6 The sections on trigonometric equations was completely rewritten. Added a summary of the procedures for solving oblique triangles.

Added a subsection showing how to use area formulas to find the altitude of a triangle. Chapter 8 Added a summary of the methods for solving three equations in three unknowns. Added an example showing how to find a Partial-Fraction Decomposition when the denominator has repeated linear factors. Chapter 9 Added a schematic showing the most common transformations and their corresponding matrices. Added a discussion about the connection between combining transformations and multiplying their corresponding matrices and showing that the order in which the transformations are performed matters. Chapter 10 Sections Chapter 11 Expanded discussion, with examples, showing the connection between arithmetic sequences and linear functions and between geometric sequences and exponential functions.
