## **Body Sculpting**

### **Kybella**

Kybella is a manmade form of a substance your body makes that helps to absorb fats. Deoxycholic acid works by destroying fat cells where it is injected into the body. Kybella injection is used to help decrease the appearance of fat that hangs below the chin, sometimes called a double-chin. Kybella is a nonsurgical injection technique used to reduce excess fat beneath the chin. Each treatment takes about 15 to 20 minutes.
