

Excretion

- OB20 understand the structure and function of the urinary system: the bladder, renal artery, renal vein, ureter, urethra and kidney
- OB21 name the products of excretion: CO₂, water and urea
- OB22 understand the function of the skin in the excretion of waste products made in the body
- OB23 recall that waste products are removed from the bloodstream by filtration in the kidneys in the form of urine, which contains urea, water and salts, and that urine is stored in the bladder before being released from the body.
