

# Proteins: higher orders of structure. Myoglobin and hemoglobin; collagen

Vedrana Čikeš Čulić

storage and transport

enzymatic catalysis

immune protection

creating and conducting of nerve impulse

hormonal regulation

mechanical strength

gene expression control

coordinated movement

# PROTEINS

CONFIGURATION

VS

CONFORMATION

# Characteristics of proteins

- SOLUBILITY at physiologic pH:  
SOLUBLE vs NON-SOLUBLE
- SHAPE:  
GLOBULAR vs FIBROUS
- NONPROTEIN GROUPS:  
LIPOPROTEINS, GLYCOPROTEINS,  
METALLOPROTEINS

# Levels of the protein structure

- **PRIMARY STRUCTURE**—the sequence of the amino acids
- **SECONDARY STRUCTURE**—geometrically ordered units
- **TERTIARY STRUCTURE**—the assembly of secondary structural units into larger functional units
- **QUATERNARY STRUCTURE**—the number and types of polypeptide units of oligomeric proteins and their spatial arrangement

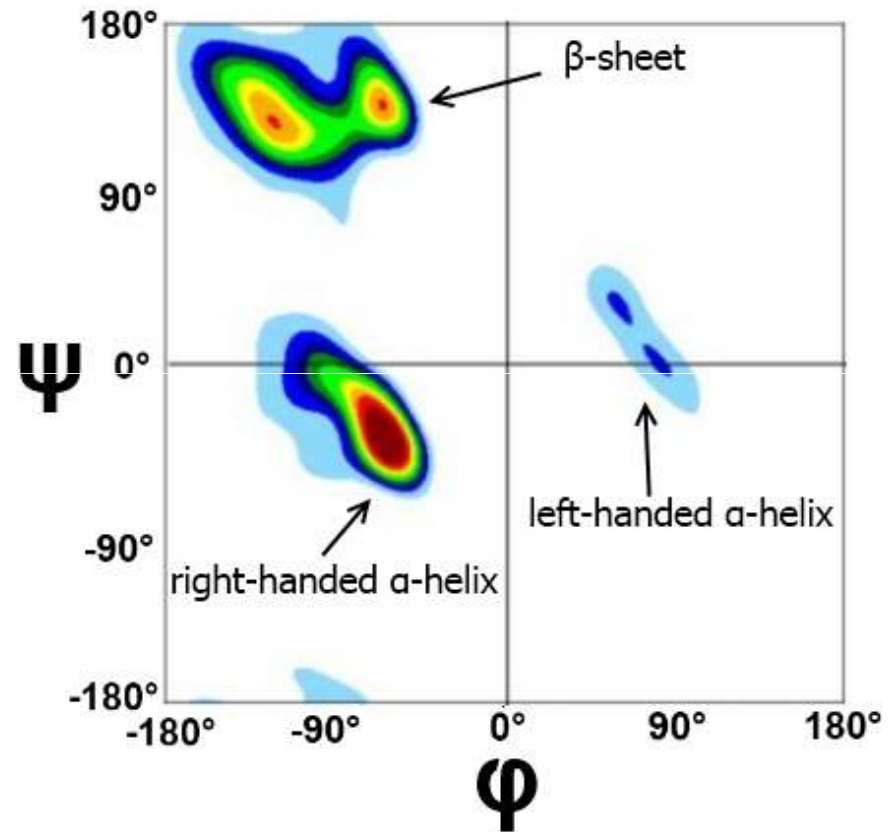

# Secondary Structure

Ramachandran plot shows allowed and non-allowed phi ( $\Phi$ ) and psi ( $\Psi$ ) values

# $\alpha$ -Helix

- constant  $\Phi$  and  $\Psi$  angles
- average of 3.6 amino-acid residues per pitch
- R groups face outward
- only L-amino acids
- only right-handed helices

# $\alpha$ -Helix

- **HYDROGEN BONDS** - between the oxygen of the peptide bond carbonyl and the hydrogen atom of the peptide bond nitrogen of the fourth residue down the polypeptide chain
- **amphipathic helices**

# $\beta$ -Sheet

Figure 4-10 part 2 of 2 Essential Cell Biology, 2/e. (© 2004 Garland Science)

- zig-zag pattern
- R groups of adjacent residues point in opposite directions
- the peptide backbone is highly extended
- **hydrogen bonds** - adjacent segments of the sheet

# $\beta$ -Sheet

ANTIPARALLEL  
 $\beta$ -SHEET

PARALLEL  
 $\beta$ -SHEET

# Loops & Bends

# Supersecondary structures

$\beta$ - $\alpha$ - $\beta$  unit

Hairpin

$\beta$ -meander

Greek Key Motif

# Tertiary Structure

- 3D conformation of a polypeptide
- The sequence of amino acids determines the tertiary structure
- **DOMAINS** – formation of assembled secondary structural features (helix, sheet, bend, turn, loop) – functional unit of protein

# Quaternary structure

- Two or more polypeptide chains (protomers)

- MONOMERIC, DIMERIC etc.

- HOMODIMER vs HETERODIMER

(a) Collagen

(b) Hemoglobin

# Stabilization of the Tertiary & Quaternary Structure

- noncovalent interactions
- hydrophobic interactions
- hydrogen bonds
- disulfide bonds

# X-Ray Crystallography

## NMR spectroscopy

- determination of protein 3D structure

# Folding $\leftrightarrow$ Denaturation

# Chaperones

# Collagen

- FIBROUS protein
- structural strength for cells and tissues
- constituent of skin, bones, teeth, ligaments, tendons

# Collagen

Amino acid sequence –Gly – X – Y – Gly – X – Y – Gly – X – Y –

2° structure 

Triple helix 

- triple helix
- TROPOCOLLAGEN
- every third amino acid residue is **GLYCINE**
- rich in **proline** and **hydroxyproline**

# Collagen

## OSTEOGENESIS IMPERFECTA

## SCURVY

Hemoglobin

Myoglobin

# Myoglobin & Hemoglobin

- HEME proteins
- Supply of OXYGEN:
  - ✓ Myoglobin → red muscle
  - ✓ Hemoglobin → erythrocytes

# Heme

- prosthetic group of: Hb and Mb ( $\text{Fe}^{2+}$ )  
cytochromes ( $\text{Fe}$  and  $\text{Cu}$ )  
chlorophyll ( $\text{Mg}$ )
- cyclic tetrapyrrole

# Myoglobin

- oxygen storage in red muscle
- responsible for **RED COLOR** of tissues
- **ONE** polypeptide chain + **ONE** Heme
- **GLOBULAR** protein
- sea mammals = lots of myoglobin in muscle

# Myoglobin

- distal histidine
- proximal histidine
- heme
- Pr = propionate

# The Iron Moves Toward the Plane of the Heme When Oxygen Is Bound

# CO and O<sub>2</sub> are competing for the same binding site on heme

- Isolated heme binds CO **25,000** times more strongly than O<sub>2</sub>
- Distal His weakens the binding of CO:
  - forcing it to bind at an angle and not perpendicular
  - enhances the binding of O<sub>2</sub>
- Hb and Mb bind CO **200** times more strongly than O<sub>2</sub>

# The Oxygen Dissociation Curves

- Myoglobin  
(monomer)

hyperbolic curve

- Hemoglobin  
(tetramer)

sigmoid curve

# Hemoglobin quaternary structure

- **ALLOSTERIC** protein
- **TETRAMERIC** - pairs of two different polypeptide subunits:  $\alpha_1\alpha_2\beta_1\beta_2$
- **Covalent bonds** between subunits

## Myoglobin & the Subunits of Hemoglobin Share Almost Identical Secondary and Tertiary Structures

# Cooperative binding

## Fetal hemoglobin HbF ( $\alpha_2\gamma_2$ )

# Oxygenation of Hemoglobin Is Accompanied by Large Conformational Changes

T = Taut  
low affinity for O<sub>2</sub>

R = Relaxed  
high affinity for O<sub>2</sub>

## Transition from the T structure to the R structure

- all subunits of deoxyHb are in T structure
- successive  $O_2$  binding makes R structure more probable
- first molecule  $O_2$  binds to T structure, and fourth molecule to R structure

# Hemoglobin transports CO<sub>2</sub> and protons to the lungs

## CARBAMATE

- + to -
- salt bridge formation
- 15% CO<sub>2</sub> in venous blood

## BICARBONATE

- ~80% CO<sub>2</sub> in venous blood

# Bohr effect

- Reciprocal coupling of proton and  $O_2$  binding
- Mechanism of oxygen delivering to the cells according to their needs
- Metabolically active cells, which need lot of oxygen, produce lot of waste products:  $H^+$  and  $CO_2$

# Bohr effect

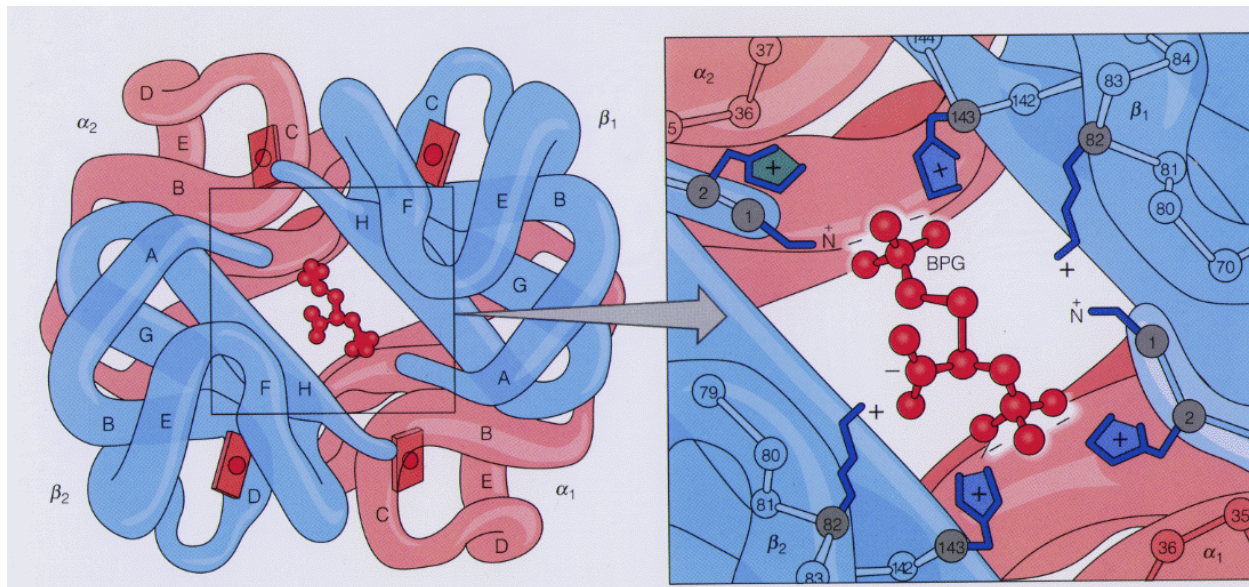

## 2,3- bisphosphoglycerate (BPG) stabilizes the T structure of hemoglobin

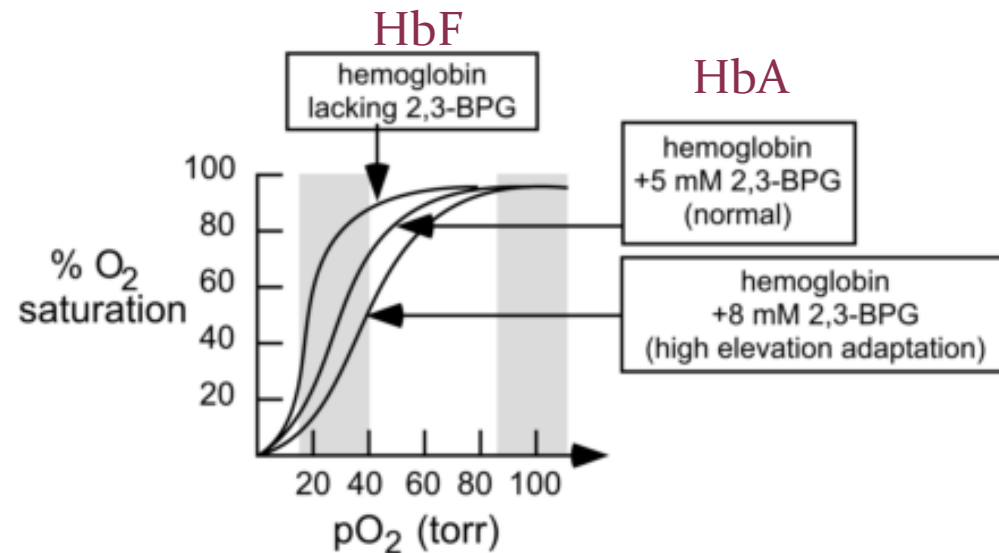

- BPG forms **salt bridges** with the terminal amino groups of  **$\beta$  chains**
- BPG binds more **weakly** to HbF than to HbA  $\rightarrow$  HbF having a higher affinity for O<sub>2</sub> than HbA.

# Adaptation to high altitude

- increased number of erythrocytes
- increased concentration of Hb and BPG

# Methemoglobin

- Heme iron is **ferric** ( $\text{Fe}^{3+}$ ) rather than **ferrous** ( $\text{Fe}^{2+}$ )
- $\text{Fe}^{3+}$  doesn't bind  $\text{O}_2$ 
  - is coordinated by  $\text{H}_2\text{O}$  molecule on 6<sup>th</sup> coordination site
- Causes the **brown color** of dried blood or old meat
- Enzyme **methemoglobin reductase** reduces the  $\text{Fe}^{3+}$  of methemoglobin to  $\text{Fe}^{2+}$
- The resulting tissue hypoxia leads to **polycythemia**, an increased concentration of erythrocytes

# Hemoglobin S – sickle cell anemia

# Biomedical implications of Hb

- **Myoglobinuria** - myoglobin in urine
- **Anemia** - reduction in the number of red blood cells or of hemoglobin in the blood
- **Thalassemia** - partial or total absence of one or more  $\alpha$  or  $\beta$  chains of hemoglobin
- **Glycated Hemoglobin (HbA<sub>1c</sub>)**
