## A-level PHYSICS

## Paper 2

Wednesday 21 June 2017
Morning
Time allowed: 2 hours

## Materials

For this paper you must have:

- a pencil and a ruler
- a scientific calculator
- a Data and Formulae booklet.

## Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer all questions.
- You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
- Do all rough work in this book. Cross through any work you do not want to be marked.
- Show all your working.

## Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 85 .
- You are expected to use a scientific calculator where appropriate.
- A Data and Formulae Booklet is provided as a loose insert.

## Section A

Answer all questions in this section.

| $\mathbf{0}$ | $\mathbf{1}$ | $\mathbf{1}$ A number of assumptions are made when explaining the behaviour of a gas using |
| :--- | :--- | :--- | :--- | the molecular kinetic theory model.

State one assumption about the size of molecules.

$\qquad$

Figure 1 shows how the pressure changes with volume for a fixed mass of an ideal gas.

At $\mathbf{A}$ the temperature of the gas is $27^{\circ} \mathrm{C}$. The gas then undergoes two changes, one from $\mathbf{A}$ to $\mathbf{B}$ and then one from $\mathbf{B}$ to $\mathbf{C}$.

Figure 2 shows two magnets, supported on a yoke, placed on an electronic balance.

Figure 2

The magnets produce a uniform horizontal magnetic field in the region between them. A copper wire DE is connected in the circuit shown in Figure $\mathbf{2}$ and is clamped horizontally at right angles to the magnetic field.

Figure 3 shows a simplified plan view of the copper wire and magnets.
Figure 3

When the apparatus is assembled with the switch open, the reading on the electronic balance is set to 0.000 g . This reading changes to a positive value when the switch is closed.

| $\mathbf{0}$ | $\mathbf{2}$ | $\mathbf{1}$ Which of the following correctly describes the direction of the force acting on the |

| :--- | :--- | A cyclotron has two D-shaped regions where the magnetic flux density is constant. The D-shaped regions are separated by a small gap.

An alternating electric field between the D-shaped regions accelerates charged particles. The magnetic field causes the charged particles to follow a circular path.

Figure 4 shows the path followed by a proton that starts from $\mathbf{O}$.

Figure 4

| $\mathbf{0}$ | $\mathbf{3}$ | $\mathbf{1}$ Explain why it is not possible for the magnetic field to alter the speed of a proton |

## Section B

## Each of Questions 8 to $\mathbf{3 2}$ is followed by four responses, A, B, C and D.

For each question select the best response.

Only one answer per question is allowed.
For each answer completely fill in the circle alongside the appropriate answer.
CORRECT METHOD - WRONG METHODS $\infty<\infty$

If you want to change your answer you must cross out your original answer as shown.

If you wish to return to an answer previously crossed out, ring the answer you now wish to select as shown.

You may do your working in the blank space around each question but this will not be marked.
