

Kill Mosquitoes Where They Breed...

Without Nasty Chemicals!

Aquatain AMF is a unique liquid which spreads across the water surface, forming a very thin film and preventing mosquitoes from breeding for around 4 weeks.

We are delighted that, after extensive evaluation, Aquatain AMF has been prequalified by the World Health Organization (WHO) for procurement by international agencies and countries in tackling malaria, dengue and other mosquito-borne diseases.

The WHO prequalification scheme replaces the previous WHOPES scheme.

MosquitoBlocks are small briquettes which contain Aquatain AMF. Just drop a piece into standing water, and it will slowly release the Aquatain AMF as the briquette breaks down. Effective for at least 3 months!

Aquatain AMF

LIQUID MOSQUITO FILM

What is Aquatain AMF?

It's a unique silicone-based liquid for mosquito control. It spreads rapidly across the water surface, forming a very thin film.

How Does It Work?

There aren't any toxic chemicals in Aquatain AMF. It works by reducing the surface tension of the water so that mosquito larvae and pupae can't attach themselves at the surface to breathe – causing them to drown.

The very thin layer of Aquatain AMF on the surface will prevent mosquitoes from breeding for up to 4 weeks. (Young wrigglers may still be present after treatment, but they will die before they turn into adults). Once the film is on the surface, there is no emergence of adults.

Where Can It Be Used?

Aquatain AMF can be used on any standing water where mosquitoes breed. This includes gutters, ponds, blocked drains, water tanks, pot plants, barrels, latrines and old tyres, but it can also be used on much larger water areas such as swamps, polluted canals, etc.

How Is Aquatain AMF Applied?

No spray equipment is required! Aquatain AMF will spread across the surface by itself.

For standing water with a surface area up to a few square metres, it can be simply squeezed from the bottle.

For large areas, Aquatain AMF is available in drums of various sizes. The application method is the same – simply pour it on the water and it will spread across the surface.

Is It Safe For Drinking Water?

Aquatain AMF is certified by NSF International for application to water storages.

How Effective Is It?

Independent trials around the world have confirmed that Aquatain AMF is highly effective at preventing mosquitoes from breeding.

Is Aquatain AMF Effective on all Mosquito Species?

Yes, it is effective on mosquitoes which spread dengue fever, chikungunya, malaria, West Nile Virus and other mosquito-borne diseases.

Pack sizes: from 50 ml to 200 litres.

MosquitoBlocks

When Should You Use MosquitoBlocks?

If you have any standing water in the vicinity of your home, it's likely that mosquitoes will be breeding there. MosquitoBlocks are an ideal alternative to Aquatain AMF liquid if the water is present for an extended period, as they will break down slowly – giving at least 3 months' protection.

As MosquitoBlocks are safe to use, the general public can get involved in mosquito control around their home or village. They are totally safe for people and animals, but deadly to mosquitoes!

How Many MosquitoBlocks Do You Need?

They can be used on any water containers – including permanent puddles, old tyres, small ponds, pot plant trays, air conditioner trays, and even sewer pits.

Break off one piece for small containers, and two pieces for larger containers (see instructions on pack).

Pack size: 8 pieces per MosquitoBlock pack for domestic use. Larger packs also available.
